

# Automated School IT Helpdesk Ticket Classification in ServiceNow

## PHASE 2: REQUIREMENT ANALYSIS PHASE

A thorough examination of existing support operations highlights key triage bottlenecks and defines the functional criteria required for the target system.

- **Operational Bottlenecks:** Helpdesk personnel manually inspect every incoming ticket to determine the underlying issue type, select an appropriate Category and Subcategory, and notify the caller. This manual workflow results in an error-prone process that cannot scale effectively during peak school hours or higher request volumes.

**Functional Requirements:** The ServiceNow implementation must satisfy six core operational objectives:

- **FR-01 | Automated Keyword Classification:** Automatically classify incoming IT support tickets directly from user issue descriptions.
- **FR-02 | Dynamic Field Population:** Populate both Category and Subcategory fields dynamically without human intervention.
- **FR-03 | Dependent Choice Logic:** Enforce strict dependent choice options between Category and Subcategory dropdowns.
- **FR-04 | Automated Caller Notification:** Send an automated email notification to the caller immediately upon ticket submission.
- **FR-05 | Standardized Relational Storage:** Store all incident records in a standardized, relational database table structure (u\_incident\_workflow).
- **FR-06 | No-Code Maintainability:** Remain simple to administer, maintain, and scale using native no-code platform capabilities.

### System Prerequisites & Technical Environment Specification

| Component / Parameter   | Technical Specification                      | Purpose in Project                                                            |
|-------------------------|----------------------------------------------|-------------------------------------------------------------------------------|
| Platform Instance       | ServiceNow Personal Developer Instance (PDI) | Cloud execution environment for custom table and Flow Designer.               |
| Application Scope       | Global                                       | Allows cross-platform access to core tables (sys_user, sys_user_group).       |
| Custom Table Name       | Incident WorkFlow (u_incident_workflow)      | Dedicated relational table storing school IT helpdesk tickets.                |
| Automation Engine       | ServiceNow Workflow Studio / Flow Designer   | No-code trigger, conditional branching, record update, and email engine.      |
| Configuration Packaging | Local Update Set (Project Update Set)        | Captures all dictionary, form, table, and flow customizations for XML export. |
